

Name: \_\_\_\_\_

**1 21 points**

Write the value of each of the following lisp expressions. If the expression is an ill formed lisp expression, write "error".

\_\_\_\_\_ `(- (* 8 3) (/ 12 4))`\_\_\_\_\_ `(+ (* (- 9 7) 2 5) 4)`\_\_\_\_\_ `(* (- (+ (4 5) 3) 2))`

```
(define a 3)
(define b (- a 1))
```

\_\_\_\_\_ `(> a b)`\_\_\_\_\_ `(and (= a b) (/ b (- a 3)))`\_\_\_\_\_ `(or (= a b) (+ 1 1) (< b a))`\_\_\_\_\_ `(if (and (< b a) (< a (* b b))) a b)`**2 12 points**

Testing your scoping knowledge. Assume we first make these definitions

```
(define x 2)
(define y (* 2 x))
(define z (+ x y))
(define (fun1 x y)
  (+ z y z))
(define (fun2 a b)
  (let ((x (+ a b))
        (y (* 2 x)) )
    (+ x y z) ))
```

Now evaluate the following Scheme expressions: (Hint: if uncertain about scope rules for the `let`, first re-express it using `lambda`.)

\_\_\_\_\_ `(fun1 2 3)`\_\_\_\_\_ `(fun1 x 3)`\_\_\_\_\_ `(fun2 3 4)`

### 3 15 points

Procedures that return procedures. We can “smooth” a continuous function by changing the value of the function at each point to be the average of the values at nearby points. Assume we have a function  $f(x)$ , and a “nearby” distance  $d$ . Then define

$$\text{smooth}(x) = \frac{f(x-d) + f(x) + f(x+d)}{3}.$$

Part A. Write `smoother` in Scheme. The inputs are a function  $f$  of one argument and a distance  $d$ . The output is a *new function of one argument,  $x$* , defined as the smooth above. Hint: use lambda to create this new function. Here is a start:

```
(define smoother
  (lambda (f d) ; the 2 arguments to smoother are a function and a distance.
    ; body which creates a function of x
    ...
  )
)
```

Part B. Show what you would type in the Scheme interpreter to find the smoothed value of `(sin x)` at  $x = 2$ , for distance 0.01. You don't have to show the result the interpreter would produce!

## 4 20 points

Consider the function

```
(define f
  (lambda (n)
    (if (< n 1)
        0
        (+ 1 (f (quotient n 2)))))))
```

Part A. What is

\_\_\_\_\_ (f 4)

\_\_\_\_\_ (f 6)

\_\_\_\_\_ (f 8)

\_\_\_\_\_ (f (expt 2 100))

\_\_\_\_\_ (f (- (expt 2 100) 1))

Part B. Write an iterative version of  $f$ . Your helper function may be defined inside or outside your definition of  $f$ . Hint: Remember that the main body of  $f$  merely provides the initial values to the helper function.

## 5 12 points

The C++ function `sums` below is designed to return the number of ways a positive integer `n` can be written as a sum of positive integers. In counting the number of ways, the order of writing the terms is considered irrelevant, so for example  $7 + 2 + 1$  is the same way as  $1 + 7 + 2$ . Thus `sums(4)` is 5 because the ways are  $1 + 1 + 1 + 1$ ,  $1 + 1 + 2$ ,  $1 + 3$ ,  $2 + 2$ , and 4. Notice that just writing 4 is counted as a sum (it is considered a sum of one term).

```
int sums(int n){ return sums_with_max(n, n); }

// n is the number whose sums to compute. m is the max term to use.
// Requiring 0 < m <= n.
int sums_with_max(int n, int m)
{ if (n == 0 || k == 1) return 1;
  else
    return sums_with_max(n, m-1)// sums that don't use an m.
      +
      sums_with_max(n-m, min(m, n-m)); // for the sums using at least 1 m.
}
```

Part A. Write `sums` (and `sums_with_max`) in Scheme.

Part B. Which is true, circle it, of the process generated by `sum`.  
It is:    iterative,    linear-recursive (but not iterative),    or tree recursive.

## 6 20 points

Exercise on speed of fast and slow exponentiation.

```
(define (expt-v1 b e)
  (if (zero? e)
      1
      (* b (expt-v1 b (- e 1)))))
```

```
(define (expt-v2 b e)
  (cond ((zero? e) 1)
        ((even? e) (square (expt-v2 b (quotient e 2))))
        ((odd? e) (* b (expt-v2 b (- e 1)))))
```

Part A. (Remark:  $1024$  is `(expt 2 10)` and  $1048576 = 1024^2 =$  `(expt 2 20)`.) Answers which are correct to within a factor of 2 will be counted as correct.

- \_\_\_\_\_ If `(expt-v1 1.01 1024)` takes one second, about how long do you expect `(expt-v1 1.01 2048)` to take?
- \_\_\_\_\_ If `(expt-v1 1.01 1024)` takes one second, about how long do you expect `(expt-v1 1.01 1048576)` to take?
- \_\_\_\_\_ If `(expt-v2 1.01 1024)` takes one second, about how long do you expect `(expt-v2 1.001 2048)` to take?
- \_\_\_\_\_ If `(expt-v2 1.01 1024)` takes one second, about how long do you expect `(expt-v2 1.001 1048576)` to take?
- \_\_\_\_\_ If `(expt-v1 1.01 1024)` takes one second on computer X, about how long do you expect `(expt-v2 1.01 1024)` to take on computer X?

Part B. Write a definition of `expt-v1` which uses `cond` rather than `if`.

Part C. Write a definition of `expt-v2` which uses `if(s)` rather than `cond`.

Gee-whiz question about compound interest ( This is not part of the test): If you invest 1 dollar at 1% interest per month, after 100 years, what do you have?

Answer: `(expt 1.01 1200)`, which is 153337 dollars, a 5 orders of magnitude increase!
