

# Homework 4:

Create a folder called HWK4. Either create a web page (perhaps for your web site project) or copy a web page you made for a previous homework into the HWK4 folder. Then create a style sheet and link it to your web page. Add the following:

1. Use float to position an element on your web page.
2. Use clear to make sure that an element clears to the left (or right)
3. Position an element absolutely. Notice how, when you resize your web page, everything flows below this. Scroll up and down. Notice how it stays in place on the web page (e.g., it scrolls off the page).
4. Position something with fixed position. Notice how, when you scroll up and down, it still stays on the web page.
5. Position something relatively. Notice that you can use negative numbers to move the image left and up.
6. Use the z-index to control the order of things positioned absolutely, relatively, or fixed.
7. Set a style for a:link, a:hover, and a:visited.

To turn in: Upload HWK4 and turn in the URL via sakai.

Continue working on your Web site project.
