Compile It! Jeopardy!

A Few Simple Rules

1. Three Rounds: Jeopardy!, Double Jeopardy, Final Jeopardy
2. I choose the question – category and point value.
3. Your team has 1 minute to write an answer.
4. Give answer to your judge, who decides and records score.
5. Highest score wins.
6. Wager any number of points in Final Jeopardy round.

compile Jeopardy

Got Team?
Got Paper?
Here we go...

Jeopardy!

Round 1

[Click to Double Jeopardy](#)

General Compilers++	Scanning	Grammars	Parsing	Symbol Tables
<u>100 Point</u>	<u>100 Point</u>	<u>100 Point</u>	<u>100 Point</u>	<u>100 Point</u>
<u>200 Points</u>	<u>200 Points</u>	<u>200 Points</u>	<u>200 Points</u>	<u>200 Points</u>
<u>300 Points</u>	<u>300 Points</u>	<u>300 Points</u>	<u>300 Points</u>	<u>300 Points</u>

**C100: List 3
advantages of a
compiler over an
interpreter**

C100 Answer:

Execution of code faster

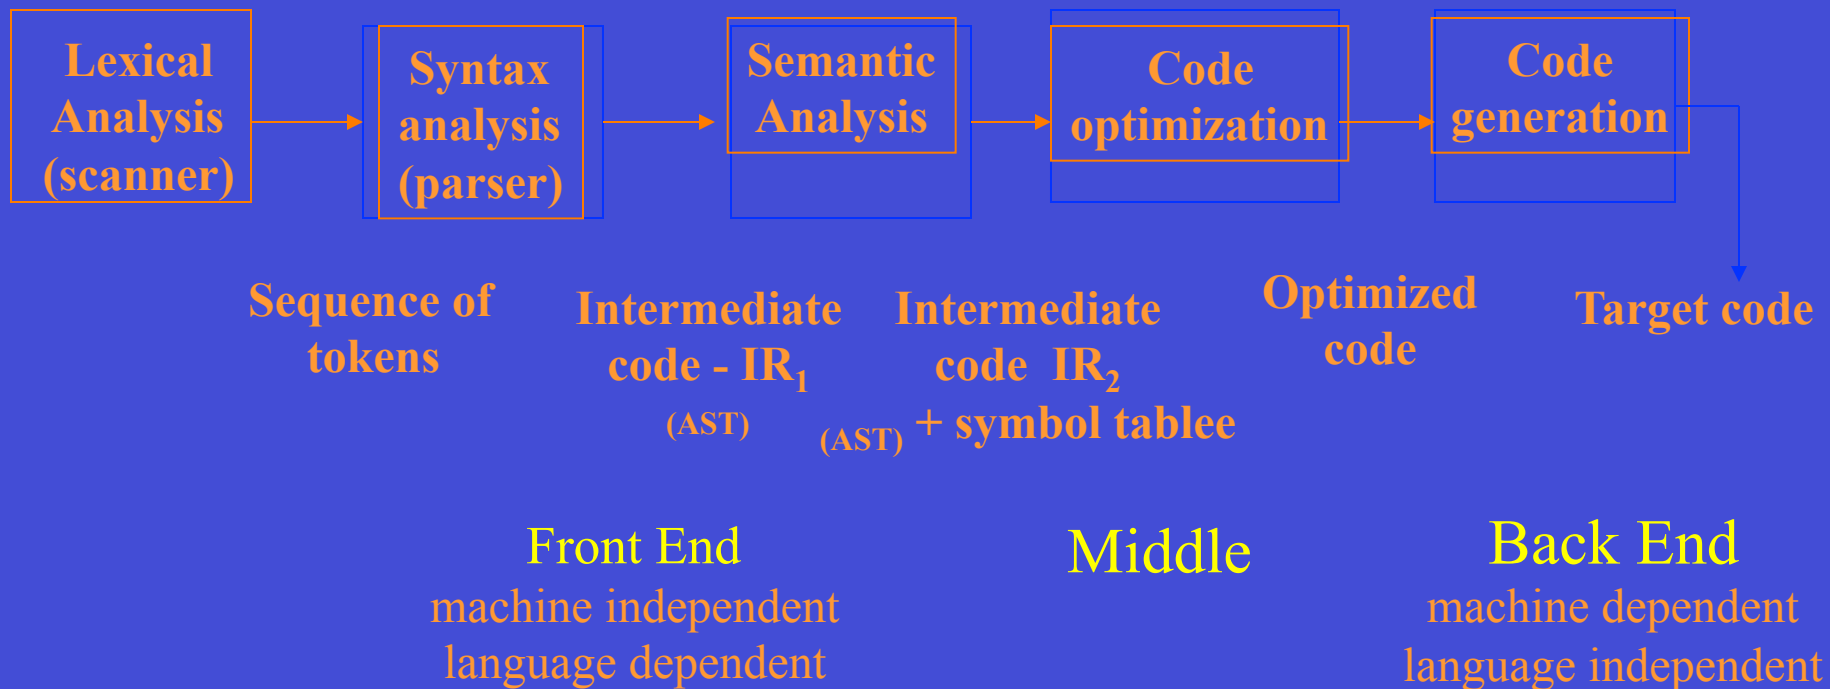

Exploit architecture

Compilation only once – execute compiled code

Ability to optimize the code

**C200: Draw the
major compiler
phases and their
inputs & outputs**

C200 Answer:

C300: Give 1 example of an error typically caught by the scanner, 1 caught during parser, and 1 error caught during semantic analysis.

C300 Answer:

Misformed token – ab#q
Statement misformed – x ::= y
Variable not declared

**S100: Show an example
that clearly
demonstrates the
difference between
lexeme and token.**

S100 Answer:

Token – ID
Lexeme - max

S200: Which of the following strings is accepted by the regular expression $bba^*b^*(ab^*a^*b)^*$

1. **bbab**

2. **bbaabab**

3. **bbaabbabba**

S200

1. **bbab**
2. **bbaabab**

S300: Write a regular expression representing the strings accepted by this DFA.

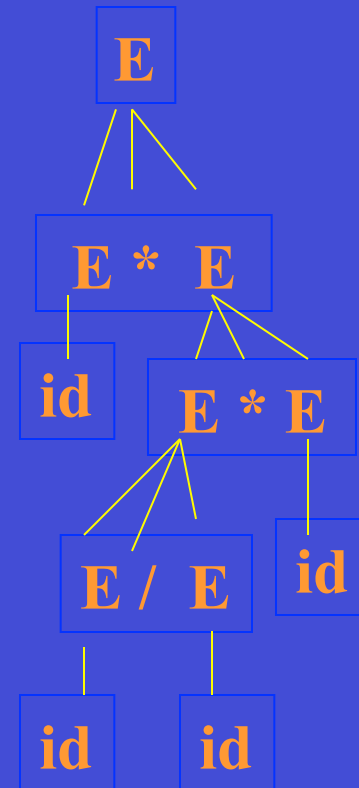

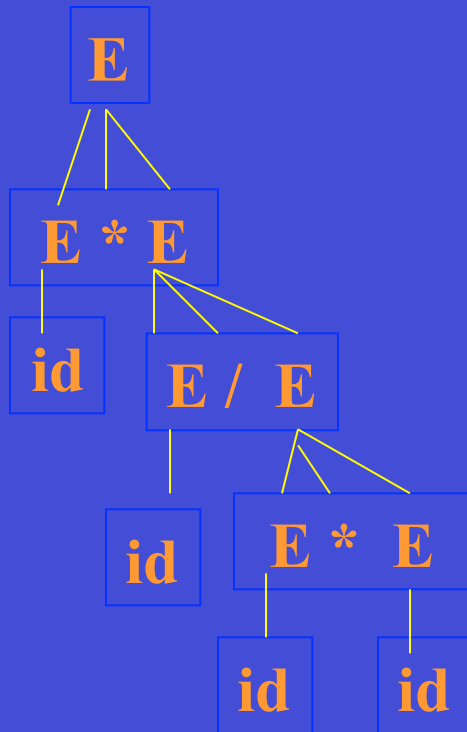

S300 Answer:

$(0|1)^* 00$

G100: Show that this grammar is ambiguous.

$E \rightarrow E * E \mid E / E \mid id$

G100 Answer:

**G200: Eliminate left
recursion from this
grammar using the
general rule:**

$D \rightarrow D , id \mid id$

G200 Answer:

$D \rightarrow id A'$
 $A' \rightarrow , id A' \mid \varepsilon$

**G300: Given the following grammar,
what are the precedence and
associativity rules for the operators?**

$$E \rightarrow E \& T \mid T \% E \mid T$$
$$T \rightarrow T \# F \mid T @ F \mid F$$
$$F \rightarrow g$$

G300 Answer:

Precedence:

#/ @

& %

Associativity

& is left

% is right

is left

@ is left

P100: What additional information is needed to determine if this state is adequate in an SLR(1) grammar?

$E \rightarrow T.$

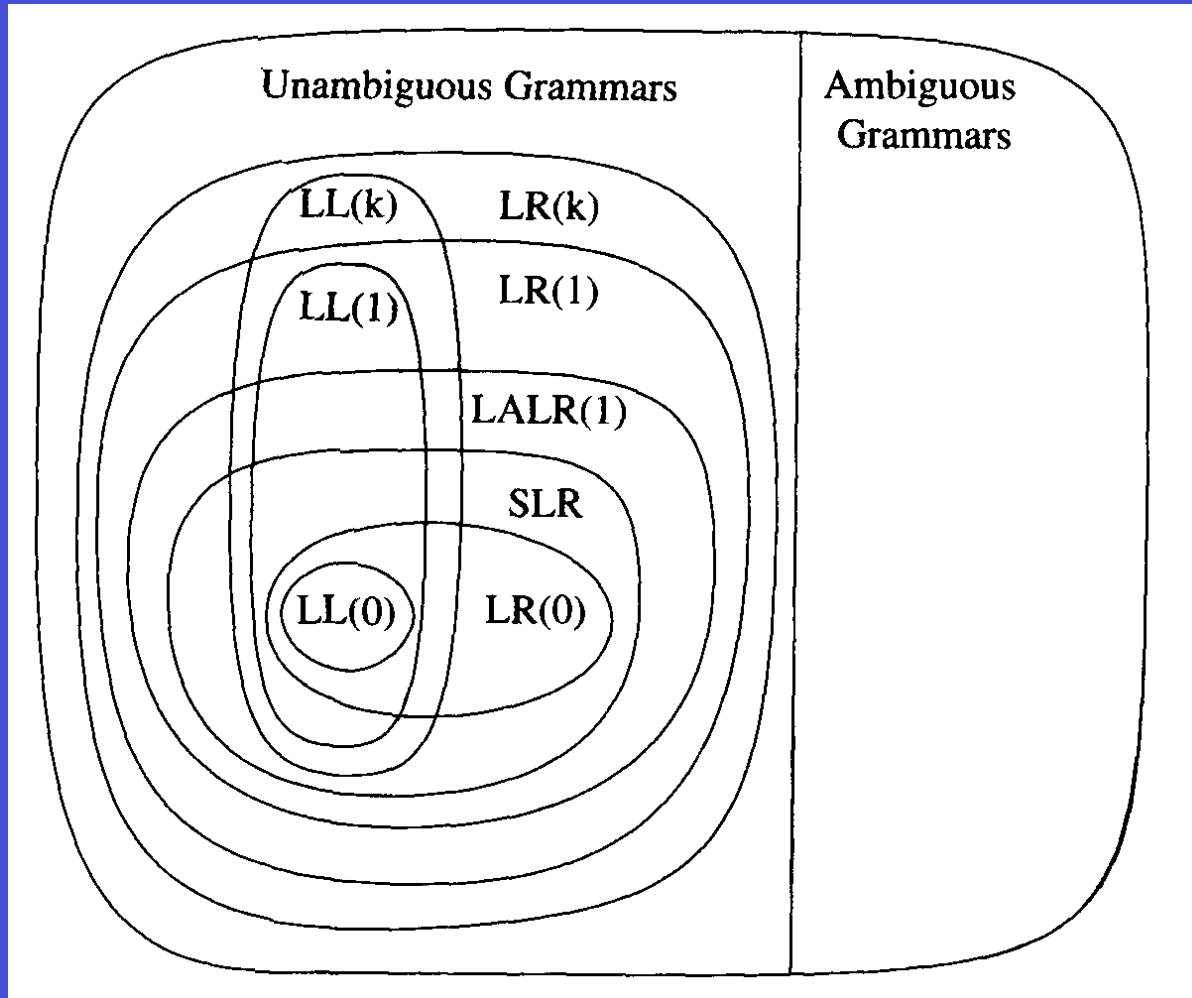

$T \rightarrow T.+f$

P100 Answer:

Follow set of E

**P200: Show the
grammar hierarchy
including LR family,
LL(1), ambiguous and
context-free grammars**

P200

P300: Given the LR(1) state

S8: [E ->a., {;,+}]

[E-> E.*T, {;}]

**Give the table entries for state 8 in
the LR(1) parse table.**

P300 Answer:

+	;	*
R1 {E \rightarrow A}	R {E \rightarrow A}	S {E \rightarrow E *T}

ST100: List the major operations performed on a symbol table.

ST100 Answer:

- `enter_scope()` start a new nested scope
- `lookup(x)` finds current `x` (or null) via scoping rules
- `insert_symbol(x)` add a symbol `x` to the table
- `local-lookup(x)` determines if `x` in local scope
- `exit_scope()` exit current scope

ST200: List 2 semantic checks that can be done at compile time and 2 that need to wait until runtime.

ST200 Answer:

Compile time:

Variable declared before use

Number of parameters matches number of arguments

Run time:

Subscripts in range

Size of array must be positive

**ST300: Describe
how each ST
operation uses the
active ST stack**

ST300 Answer:

Enter scope: Produces new symbol table for declarations

Loopup (x) Searches stack from top for first use of variable

Insert_symbol – inserts variable in current symbol table – top of stack

Local-lookup – determines if x is in current block at top of stack

Exit_scope – removes current symbol table from stack

Double Jeopardy

[Click to
Final Jeopardy](#)

Topdown	General Parsing	Bottomup	Surprise
<u>200 Point</u>	<u>200 Point</u>	<u>200 Point</u>	<u>200 Point</u>
<u>400 Points</u>	<u>400 Points</u>	<u>400 Points</u>	<u>400 Points</u>
<u>600 Points</u>	<u>600 Points</u>	<u>600 Points</u>	<u>600 Points</u>

GP200: Name at least 2 differences between top down and bottom up parsing.

GP200 Answer:

Top down goal directed – from top matches string
Bottom up – reduces string

Top down cannot handle left recursive grammars
Bottom up can handle left recursive grammars

GP400: Left factoring:

Which kind of parsing is it done for?

What problem does it solve?

Show an example.

GP400 Answer:

Predictive top down parsing

It avoids the parser having to backtrack after wrong decisions

Due to common prefixes.

Example: common prefix is 'a'

$X \rightarrow a B \mid a C$

$C \rightarrow B d e \mid d$

$B \rightarrow x$

GP600: Conflicts in Bison:

What happens if you don't resolve
them?

How can you resolve them?

GP600 Answer:

Get shift reduce errors or reduce reduce errors
Can resolve them using special symbols to indicate
Associativity and Precedence of operators

Or can change grammar

**T200: Compute the FIRST for
each right hand side of the
grammar:**

$E \rightarrow E + T \mid T$

$T \rightarrow T \& S \mid S \mid a$

$S \rightarrow S / F \mid (F) \mid b$

$F \rightarrow c$

T200 Answer:

First E = {a, b, (, c}
etc

T400: Compute the Follow for each nonterminal in:

$E \rightarrow TB$

$B \rightarrow + TB \mid \epsilon$

$T \rightarrow FC$

$C \rightarrow *FC \mid \epsilon$

$F \rightarrow (E) \mid a$

T400 Answer:

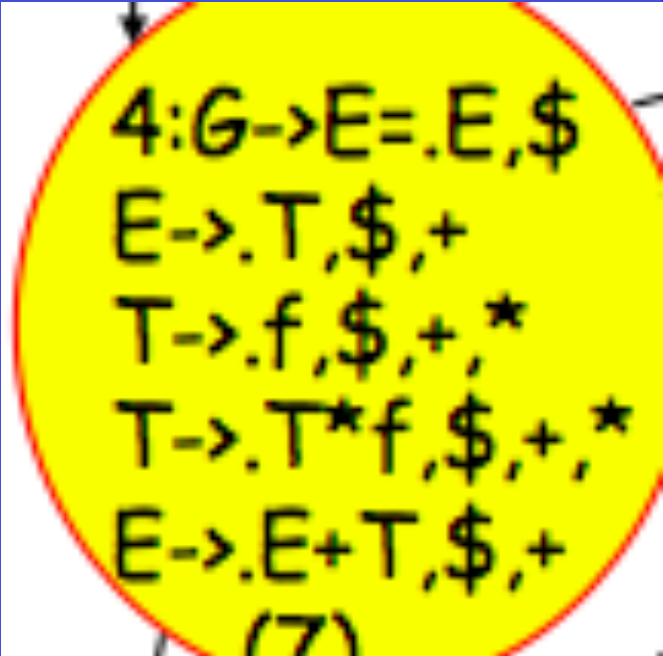

**T600: Write the
conditions for a
grammar G to be
LL(1)**

T600 Answer:

A grammar G is LL(1) iff
whenever there exists $A \rightarrow \alpha \mid \beta$ in G ,
all of the following conditions hold true:

- * $\text{FIRST}(\alpha) \cap \text{FIRST}(\beta) = \emptyset$
- * At most 1 of α and β derive the empty string
- * If β derives the empty string, then $\text{FIRST}(\alpha) \cap \text{FOLLOW}(A) = \emptyset$

B200: Show the LR(1) table entries for the state:

4: $G \rightarrow E = .E, \$$
 $E \rightarrow .T, \$, +$
 $T \rightarrow .f, \$, +, *$
 $T \rightarrow .T^*f, \$, +, *$
 $E \rightarrow .E + T, \$, +$
(7)

B200 Answer:

B400: For the grammar below, show the LR(1) and the LR(0) closures for the initial state $S' \rightarrow \cdot G$

$S' \rightarrow G$

$G \rightarrow E = E \mid f$

$E \rightarrow T \mid E + T$

$T \rightarrow f \mid T * f$

B400 Answer:

B600: What are the two ways to create an LALR(1) parser without using a parser generator?

B600 Answer:

**Construct LR(1) sets of items
And merge core states**

Or

**Construct LR(0) sets of items and lookahead
Sets as you create the LR(0) items**

**SU200: What is the
full name of the chair
of our CS
department?**

SU200 Answer:

SU400: When there is no local declaration of a name, where do we go next to look for it in **STATIC scoping? **DYNAMIC** scoping?**

SU400 Answer:

Static scoping:

**Search Symbol tables for static scoping based on scoping from text of program – most closely nested rule ;
Next outer block from current block (not always global)**

Dynamic Scoping:

**Search symbol tables based on run time calls; the caller's
Stack frame**

**SU600: List 5 entities
that are named in the
Decaf language**

SU600 Answer:

Program
Variable
Formals
Interface
Class

Final Jeopardy

Here we go!!!

[Click here for
Final Jeopardy](#)

**What has been the
value of compilers
in computing
technology?**

Ability to write code in high level languages
