

# CISC103 Homework 1:

Note: If you are following this in class, Part B (below) pertains to the first week of class.

You will be turning in 2 separate files: one html template (with the very basic html tags) that validates, and a second html file, made from a copy of the template, in which you implement 7-13. Both web pages should be uploaded to the server (as per lab on Friday), and the urls of each submitted on Sakai.

HTML Template:

1. Create an html template. Make sure it validates using the w3c validator.

HTML Web Page:

1. From the template, create a second web page
2. Inside the head section of the web page, add a title (To make the TA's life easier, go with your name and Homework 1)
3. Include at least 2 different types of headers
4. Include a paragraph.
5. In that second web page, include an unordered list of at least 3 places you want to and/or would love to visit
6. Now, within that list, choose one of the places and create a sub list of places within that place you'd love to visit. For example, if you picked Italy, you might make a sublist that might include Florence, Rome, and Venice. Your List should look something like this:
  - France
  - Italy
    - Florence
    - Rome
    - Venice
  - Australia

Web Page Part B:

7. Create a header for "Internet Questions" (maybe an h2)
8. Underneath the header, create an ordered list.
9. For each list item in the ordered list, answer the following questions:
  - a. What is your TA's name and email address?
  - b. Briefly (in two sentences or less) what is the difference between TCP/IP and HTTP?
  - c. Define the term: URL
  - d. Briefly describe the client-server model.
  - e. What two things does the browser do?

*Make sure the second html page validates!!!*

Turn in the template html page and the second html page as well via sakai
